

# **GUT CHECK**

**The card game that illustrates how public health pricing & quality data lead to higher quality outcomes at reduced prices.**

Gut Check is the game of ‘truth or care’ that models the quality and cost of health care. The game models the benefits of sharing an institution’s quality information.

Gut Check players alternate taking the provider and patient roles. As patients, players seek the best care for the best price.

As providers, players must decide whether to research and publish data regarding their own institution’s quality. Gut Check highlights the need for transparency in patient decision-making.

Players use the information available to them when they need care, and demand more data when little can be found.
